# Dynamical systems

A *dynamical system* is a compact Hausdorff space  $X$  and a continuous self-map  $f : X \rightarrow X$ .

# Dynamical systems

A *dynamical system* is a compact Hausdorff space  $X$  and a continuous self-map  $f : X \rightarrow X$ .

The *shift map*  $\sigma : \omega^* \rightarrow \omega^*$  is the self-homeomorphism of  $\omega^*$  induced by the successor function on  $\omega$ .

# Dynamical systems

A *dynamical system* is a compact Hausdorff space  $X$  and a continuous self-map  $f : X \rightarrow X$ .

The *shift map*  $\sigma : \omega^* \rightarrow \omega^*$  is the self-homeomorphism of  $\omega^*$  induced by the successor function on  $\omega$ .

$(X, f)$  is a *quotient* of  $(\omega^*, \sigma)$  if there is a continuous surjection  $Q : \omega^* \rightarrow X$  such that  $f \circ Q = Q \circ \sigma$ .

$$\begin{array}{ccc}
 \omega^* & \xrightarrow{\sigma} & \omega^* \\
 \downarrow Q & & \downarrow Q \\
 X & \xrightarrow{f} & X
 \end{array}$$

# A question and two partial answers

**Question:** Which dynamical systems are quotients of  $(\omega^*, \sigma)$ ?

# A question and two partial answers

**Question:** Which dynamical systems are quotients of  $(\omega^*, \sigma)$ ?

A dynamical system  $(X, f)$  is *weakly incompressible* if there is no open  $U \subseteq X$ , with  $\emptyset \neq U \neq X$ , such that  $f(\overline{U}) \subseteq U$ .

# A question and two partial answers

**Question:** Which dynamical systems are quotients of  $(\omega^*, \sigma)$ ?

A dynamical system  $(X, f)$  is *weakly incompressible* if there is no open  $U \subseteq X$ , with  $\emptyset \neq U \neq X$ , such that  $f(\overline{U}) \subseteq U$ .

## Theorem

If  $w(X) < \mathfrak{p}$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.

## Theorem

If  $w(X) \leq \aleph_1$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.

Extending maps from  $\omega^*$  to  $\beta\omega$ 

For compact  $X$ , every map  $\omega \rightarrow X$  induces a continuous function  $\omega^* \rightarrow X$ .

# Extending maps from $\omega^*$ to $\beta\omega$

For compact  $X$ , every map  $\omega \rightarrow X$  induces a continuous function  $\omega^* \rightarrow X$ . Given a continuous map  $Q : \omega^* \rightarrow X$ , let us say that  $Q$  is *induced* if it arises in this way.

# Extending maps from $\omega^*$ to $\beta\omega$

For compact  $X$ , every map  $\omega \rightarrow X$  induces a continuous function  $\omega^* \rightarrow X$ . Given a continuous map  $Q : \omega^* \rightarrow X$ , let us say that  $Q$  is *induced* if it arises in this way.

- For some spaces  $X$ , every continuous function  $\omega^* \rightarrow X$  is induced (e.g., metric spaces).

# Extending maps from $\omega^*$ to $\beta\omega$

For compact  $X$ , every map  $\omega \rightarrow X$  induces a continuous function  $\omega^* \rightarrow X$ . Given a continuous map  $Q : \omega^* \rightarrow X$ , let us say that  $Q$  is *induced* if it arises in this way.

- For some spaces  $X$ , every continuous function  $\omega^* \rightarrow X$  is induced (e.g., metric spaces).
- For other spaces this is not the case (e.g., the long line)

# Extending maps from $\omega^*$ to $\beta\omega$

For compact  $X$ , every map  $\omega \rightarrow X$  induces a continuous function  $\omega^* \rightarrow X$ . Given a continuous map  $Q : \omega^* \rightarrow X$ , let us say that  $Q$  is *induced* if it arises in this way.

- For some spaces  $X$ , every continuous function  $\omega^* \rightarrow X$  is induced (e.g., metric spaces).
- For other spaces this is not the case (e.g., the long line), but even for these spaces, we can come close:

## Lemma (Tietze)

*Suppose  $X \subseteq [0, 1]^{\aleph}$ . Then every continuous map  $\omega^* \rightarrow X$  is induced by a function  $\omega \rightarrow [0, 1]^{\aleph}$ .*

# Eventual compliance

Let  $X$  be a closed subset of  $[0, 1]^{\aleph}$  and  $f : X \rightarrow X$  continuous.

# Eventual compliance

Let  $X$  be a closed subset of  $[0, 1]^{\kappa}$  and  $f : X \rightarrow X$  continuous.

A sequence  $\langle x_n : n < \omega \rangle$  of points in  $X$  is *eventually compliant* with an open cover  $\mathcal{U}$  of  $X$  provided

- each member of  $\mathcal{U}$  that meets  $X$  contains a point of the sequence
- for all but finitely many  $n$ , there are  $U, V \in \mathcal{U}$  such that  $x_n \in U$ ,  $x_{n+1} \in V$ , and  $f(U \cap X) \cap V \neq \emptyset$ .

# Eventual compliance

Let  $X$  be a closed subset of  $[0, 1]^k$  and  $f : X \rightarrow X$  continuous.

A sequence  $\langle x_n : n < \omega \rangle$  of points in  $X$  is *eventually compliant* with an open cover  $\mathcal{U}$  of  $X$  provided

- each member of  $\mathcal{U}$  that meets  $X$  contains a point of the sequence
- for all but finitely many  $n$ , there are  $U, V \in \mathcal{U}$  such that  $x_n \in U$ ,  $x_{n+1} \in V$ , and  $f(U \cap X) \cap V \neq \emptyset$ .

# Which sequences induce quotient mappings?

## Lemma

Let  $X$  be a closed subset of  $[0, 1]^{\kappa}$  and  $f : X \rightarrow X$  continuous.

- A sequence  $\langle x_n : n < \omega \rangle$  of points in  $[0, 1]^{\kappa}$  induces a quotient mapping from  $(\omega^*, \sigma)$  to  $(X, f)$  if and only if it is eventually compliant with every open cover.

# Which sequences induce quotient mappings?

## Lemma

Let  $X$  be a closed subset of  $[0, 1]^{\kappa}$  and  $f : X \rightarrow X$  continuous.

- A sequence  $\langle x_n : n < \omega \rangle$  of points in  $[0, 1]^{\kappa}$  induces a quotient mapping from  $(\omega^*, \sigma)$  to  $(X, f)$  if and only if it is eventually compliant with every open cover.
- Conversely, every quotient mapping from  $(\omega^*, \sigma)$  to  $(X, f)$  arises in this way.

If a sequence of points is eventually compliant with every open cover, we will say it is *eventually compliant*.

## Two examples

Example 1:  $X = [0, 1]$  and  $f = \text{id}$ 

## Two examples

Example 1:  $X = [0, 1]$  and  $f = \text{id}$ Example 2:  $X$  is disconnected and  $f = \text{id}$ 

# A proof via MA( $\sigma$ -centered): first attempt

## Theorem

*If  $w(X) < \mathfrak{p}$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.*

# A proof via MA( $\sigma$ -centered): first attempt

## Theorem

*If  $w(X) < p$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.*

- Assume  $X$  is a closed subset of  $[0, 1]^\kappa$ , where  $\kappa = w(X)$ . We want to build a sequence of points in  $[0, 1]^\kappa$  that is eventually compliant with every open cover.

# A proof via $\text{MA}(\sigma\text{-centered})$ : first attempt

## Theorem

*If  $w(X) < \mathfrak{p}$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.*

- Assume  $X$  is a closed subset of  $[0, 1]^\kappa$ , where  $\kappa = w(X)$ . We want to build a sequence of points in  $[0, 1]^\kappa$  that is eventually compliant with every open cover.
- By Bell's Theorem,  $\kappa < \mathfrak{p}$  is equivalent to  $\text{MA}_\kappa(\sigma\text{-centered})$ , so it suffices to come up with a  $\sigma$ -centered forcing that builds the desired sequence.

# A proof via $\text{MA}(\sigma\text{-centered})$ : first attempt

## Theorem

*If  $w(X) < \mathfrak{p}$ , then  $(X, f)$  is a quotient of  $(\omega^*, \sigma)$  if and only if it is weakly incompressible.*

- Assume  $X$  is a closed subset of  $[0, 1]^\kappa$ , where  $\kappa = w(X)$ . We want to build a sequence of points in  $[0, 1]^\kappa$  that is eventually compliant with every open cover.
- By Bell's Theorem,  $\kappa < \mathfrak{p}$  is equivalent to  $\text{MA}_\kappa(\sigma\text{-centered})$ , so it suffices to come up with a  $\sigma$ -centered forcing that builds the desired sequence.
- **Idea:** Let  $D$  be a countable dense subset of  $[0, 1]^\kappa$ . A forcing condition has the form  $(s, \mathcal{F})$ , where  $s$  is a finite sequence of points in  $D$  and  $\mathcal{F}$  is a finite collection of open covers.

# A proof via MA( $\sigma$ -centered): first attempt

- Intuitively,  $s$  is a finite approximation to the sequence we're trying to build, and  $\mathcal{F}$  represents a promise that as we extend  $s$ , we will do so in a way that is compliant with each member of  $\mathcal{F}$ .

# A proof via MA( $\sigma$ -centered): first attempt

- Intuitively,  $s$  is a finite approximation to the sequence we're trying to build, and  $\mathcal{F}$  represents a promise that as we extend  $s$ , we will do so in a way that is compliant with each member of  $\mathcal{F}$ .
- Formally,  $(s', \mathcal{F}')$  is stronger than  $(s, \mathcal{F})$  whenever  $\mathcal{F}' \supseteq \mathcal{F}$ , and  $s'$  extends  $s$  in a way that is compliant with each member of  $\mathcal{F}$ .

# A proof via $\text{MA}(\sigma\text{-centered})$ : first attempt

- Intuitively,  $s$  is a finite approximation to the sequence we're trying to build, and  $\mathcal{F}$  represents a promise that as we extend  $s$ , we will do so in a way that is compliant with each member of  $\mathcal{F}$ .
- Formally,  $(s', \mathcal{F}')$  is stronger than  $(s, \mathcal{F})$  whenever  $\mathcal{F}' \supseteq \mathcal{F}$ , and  $s'$  extends  $s$  in a way that is compliant with each member of  $\mathcal{F}$ .
- We would like to use  $\text{MA}_\kappa(\sigma\text{-centered})$  to get a sufficiently generic filter  $G$  of forcing conditions, and prove that  $\bigcup\{s : (s, \mathcal{F}) \in G\}$  is an eventually compliant sequence.

# Lost in space

*But this idea doesn't work!*

# Lost in space

*But this idea doesn't work!*

A condition where  
the extensions of  $s$   
are restricted

# Lost in space

*But this idea doesn't work!*

A condition where the extensions of  $s$  are restricted

A stronger condition with no restrictions on how to extend  $s$

## The fix: a safety point

Fix  $x \in X$ , and without loss of generality assume  $x \in D$ .

## The fix: a safety point

Fix  $x \in X$ , and without loss of generality assume  $x \in D$ . Using  $x$  as a “safety point,” we can keep our sequence from getting lost:

## The fix: a safety point

Fix  $x \in X$ , and without loss of generality assume  $x \in D$ . Using  $x$  as a “safety point,” we can keep our sequence from getting lost:

- A forcing condition is a pair  $(s, \mathcal{F})$ , where  $s$  is a finite sequence of points in  $D$ ,  $\mathcal{F}$  is a finite collection of open covers, **and the last point in  $s$  is  $x$ .**
- $(s', \mathcal{F}')$  is stronger than  $(s, \mathcal{F})$  whenever  $\mathcal{F}' \supseteq \mathcal{F}$  and  $s'$  extends  $s$  in a way that is compliant with every member of  $\mathcal{F}$ .

## The fix: a safety point

Fix  $x \in X$ , and without loss of generality assume  $x \in D$ . Using  $x$  as a “safety point,” we can keep our sequence from getting lost:

- A forcing condition is a pair  $(s, \mathcal{F})$ , where  $s$  is a finite sequence of points in  $D$ ,  $\mathcal{F}$  is a finite collection of open covers, **and the last point in  $s$  is  $x$ .**
- $(s', \mathcal{F}')$  is stronger than  $(s, \mathcal{F})$  whenever  $\mathcal{F}' \supseteq \mathcal{F}$  and  $s'$  extends  $s$  in a way that is compliant with every member of  $\mathcal{F}$ .

This notion of forcing is  $\sigma$ -centered, and the generic object is a sequence of points in  $[0, 1]^{\kappa}$  that is eventually compliant with every open cover.

# An inverse limit of length $\omega_1$

## Lemma

*Suppose  $X \subseteq [0, 1]^{\omega_1}$  and  $f : X \rightarrow X$  is continuous. There is a closed unbounded set of ordinals  $\alpha < \omega_1$  such that for all  $x, y \in X$ , if  $\text{prj}_{[0,1]^\alpha}(x) = \text{prj}_{[0,1]^\alpha}(y)$  then  $\text{prj}_{[0,1]^\alpha}(f(x)) = \text{prj}_{[0,1]^\alpha}(f(y))$ .*

In other words, we may find a closed unbounded set of countable ordinals  $\alpha$  such that projecting  $(X, f)$  onto the first  $\alpha$  coordinates of  $[0, 1]^{\omega_1}$  yields a quotient mapping.

# An inverse limit of length $\omega_1$

## Lemma

*Suppose  $X \subseteq [0, 1]^{\omega_1}$  and  $f : X \rightarrow X$  is continuous. There is a closed unbounded set of ordinals  $\alpha < \omega_1$  such that for all  $x, y \in X$ , if  $\text{prj}_{[0,1]^\alpha}(x) = \text{prj}_{[0,1]^\alpha}(y)$  then  $\text{prj}_{[0,1]^\alpha}(f(x)) = \text{prj}_{[0,1]^\alpha}(f(y))$ .*

In other words, we may find a closed unbounded set of countable ordinals  $\alpha$  such that projecting  $(X, f)$  onto the first  $\alpha$  coordinates of  $[0, 1]^{\omega_1}$  yields a quotient mapping.

## Corollary

*If  $(X, f)$  is a weakly incompressible dynamical system of weight  $\aleph_1$ , then it is an  $\omega_1$ -length inverse limit of metrizable dynamical systems:*

$$(X_0, f_0) \leftarrow (X_1, f_1) \leftarrow (X_2, f_2) \leftarrow \cdots \leftarrow (X_\alpha, f_\alpha) \leftarrow \cdots (X, f).$$

# A proof strategy that, once again, almost works

- 1 Suppose  $(X, f) = \varprojlim_{\alpha < \omega_1} (X_\alpha, f_\alpha)$ , where each  $(X_\alpha, f_\alpha)$  is a metrizable (and weakly incompressible) dynamical system.

# A proof strategy that, once again, almost works

- 1 Suppose  $(X, f) = \varprojlim_{\alpha < \omega_1} (X_\alpha, f_\alpha)$ , where each  $(X_\alpha, f_\alpha)$  is a metrizable (and weakly incompressible) dynamical system.
- 2 By Bowen's theorem, there is an eventually compliant sequence in  $(X_0, f_0)$ .

# A proof strategy that, once again, almost works

- 1 Suppose  $(X, f) = \varprojlim_{\alpha < \omega_1} (X_\alpha, f_\alpha)$ , where each  $(X_\alpha, f_\alpha)$  is a metrizable (and weakly incompressible) dynamical system.
- 2 By Bowen's theorem, there is an eventually compliant sequence in  $(X_0, f_0)$ .
- 3 We can try to lift this sequence through the inverse limit system: for every  $\alpha$ , we get an eventually compliant sequence  $\langle x_n^\alpha : n < \omega \rangle$  of points in  $(X_\alpha, f_\alpha)$ , and any two of these sequences agree on coordinates where both are defined.

# A proof strategy that, once again, almost works

- 1 Suppose  $(X, f) = \varprojlim_{\alpha < \omega_1} (X_\alpha, f_\alpha)$ , where each  $(X_\alpha, f_\alpha)$  is a metrizable (and weakly incompressible) dynamical system.
- 2 By Bowen's theorem, there is an eventually compliant sequence in  $(X_0, f_0)$ .
- 3 We can try to lift this sequence through the inverse limit system: for every  $\alpha$ , we get an eventually compliant sequence  $\langle x_n^\alpha : n < \omega \rangle$  of points in  $(X_\alpha, f_\alpha)$ , and any two of these sequences agree on coordinates where both are defined.
- 4 These sequences diagonalize to give us a sequence of points in  $[0, 1]^{\aleph_1}$ , and this sequence will be eventually compliant with  $(X, f)$ .

# A proof strategy that, once again, almost works

- This proof strategy is reminiscent of one of the proofs of Parovičenko's theorem (Błaszczyk and Szymański, 1980).

# A proof strategy that, once again, almost works

- This proof strategy is reminiscent of one of the proofs of Parovičenko's theorem (Błaszczyk and Szymański, 1980).
- But in order to accomplish step 3 of this strategy, we would need some variant of the following proposition:

## Wishful thinking

*Suppose  $\pi_{0,1}$  is a quotient mapping from  $(X_1, f_1)$  to  $(X_0, f_0)$ , and that  $\langle x_n^0 : n < \omega \rangle$  is an eventually compliant sequence in  $(X_0, f_0)$ . Then there is an eventually compliant sequence  $\langle x_n^0 : n < \omega \rangle$  in  $(X_1, f_1)$  such that  $\pi_{0,1}(x_n^1) = x_n^0$  for all  $n$ .*

*and this simply isn't true.*

# Eventually compliant sequences do not always lift through projection mappings
