Let ${\mathbb K}$ be an arbitrary field endowed with the discrete topology.

Introduction •୦୦୦ Linearly Compact Spaces Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Linearly Compact Spaces

Let ${\mathbb K}$ be an arbitrary field endowed with the discrete topology.

Definition

A topological vector space V over \mathbb{K} is said to be *linearly topologized* if it is a Hausdorff space in which there is a neighbourhood basis \mathcal{B} at 0 consisting of linear subspaces of V.

Introduction •୦୦୦ Linearly Compact Spaces Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Linearly Compact Spaces

Let ${\ensuremath{\mathbb K}}$ be an arbitrary field endowed with the discrete topology.

Definition

A topological vector space V over \mathbb{K} is said to be *linearly topologized* if it is a Hausdorff space in which there is a neighbourhood basis \mathcal{B} at 0 consisting of linear subspaces of V.

A closed linear variety M of a linearly topologized vector space V is a coset v + W of a closed linear subspace W of V.

Linearly Compact Spaces

Let ${\ensuremath{\mathbb K}}$ be an arbitrary field endowed with the discrete topology.

Definition

A topological vector space V over \mathbb{K} is said to be *linearly topologized* if it is a Hausdorff space in which there is a neighbourhood basis \mathcal{B} at 0 consisting of linear subspaces of V.

A closed linear variety M of a linearly topologized vector space V is a coset v + W of a closed linear subspace W of V.

Definition (Lefschetz, 1942)

A linearly topologized space V is linearly compact if, and only if, any collection of closed linear varieties of V with the finite intersection property has non-empty intersection.

Linearly Compact Spaces

Proposition (Lefschetz, 1942)

Every linearly compact space V over a discrete field \mathbb{K} is a product of one-dimensional spaces. In particular, V is compact if, and only if, \mathbb{K} is finite.

Linearly Compact Spaces

Proposition (Lefschetz, 1942)

Every linearly compact space V over a discrete field \mathbb{K} is a product of one-dimensional spaces. In particular, V is compact if, and only if, \mathbb{K} is finite.

General properties

- Let V be a linearly topologized space. Thus
- (a) if W is a linearly compact subspace of V, then W is closed;
- (b) if V is a linearly compact space, W a closed subspace of V, then W is linearly compact;
- (c) linear compactness is preserved under continuous homomorphisms;
- (d) a n.a.s.c. for a discrete V to be linearly compact is to have finite dimension. Hence every finite-dimensional V is linearly compact;
- (e) the product of linearly compact spaces is linearly compact;
- (f) an inverse limit of linearly compact spaces is linearly compact;

Locally Linearly Compact Spaces (briefly, I.I.c. spaces)

Definition (Lefschetz, 1942)

A linearly topologized space is said to be *locally linearly compact* if there is a neighbourhood basis at 0 consisting of linearly compact open subspaces.

Addition Theorem for I.I.c. spaces

Locally Linearly Compact Spaces (briefly, I.I.c. spaces)

Definition (Lefschetz, 1942)

A linearly topologized space is said to be *locally linearly compact* if there is a neighbourhood basis at 0 consisting of linearly compact open subspaces.

Remark

• Clearly, both discrete and linearly compact spaces are I.I.c. spaces.

Addition Theorem for I.I.c. spaces

Locally Linearly Compact Spaces (briefly, I.I.c. spaces)

Definition (Lefschetz, 1942)

A linearly topologized space is said to be *locally linearly compact* if there is a neighbourhood basis at 0 consisting of linearly compact open subspaces.

Remark

- Clearly, both discrete and linearly compact spaces are l.l.c. spaces.
- An l.l.c. space V over a finite field \mathbb{F} is a totally disconnected LCA group.

Addition Theorem for I.I.c. spaces

Locally Linearly Compact Spaces (briefly, I.I.c. spaces)

Definition (Lefschetz, 1942)

A linearly topologized space is said to be *locally linearly compact* if there is a neighbourhood basis at 0 consisting of linearly compact open subspaces.

Remark

- Clearly, both discrete and linearly compact spaces are l.l.c. spaces.
- An l.l.c. space V over a finite field \mathbb{F} is a totally disconnected LCA group.

Theorem (Lefschetz, 1942)

A n.a.s.c. for a vector space V to be locally linearly compact is that $V \cong V_d \times V_c$, where V_d is discrete and V_c is linearly compact.

Addition Theorem for I.I.c. spaces

Locally Linearly Compact Spaces (briefly, I.I.c. spaces)

Definition (Lefschetz, 1942)

A linearly topologized space is said to be *locally linearly compact* if there is a neighbourhood basis at 0 consisting of linearly compact open subspaces.

Remark

- Clearly, both discrete and linearly compact spaces are I.I.c. spaces.
- An l.l.c. space V over a finite field \mathbb{F} is a totally disconnected LCA group.

Theorem (Lefschetz, 1942)

A n.a.s.c. for a vector space V to be locally linearly compact is that $V \cong V_d \times V_c$, where V_d is discrete and V_c is linearly compact.

Remark

An l.l.c. space is topologically isomorphic to $\bigoplus_{i \in I} \mathbb{K} \times \prod_{i \in J} \mathbb{K}$.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define $V_c \beta \colon V_c \to V_c, \quad V_c \beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n \in \mathbb{N}} \in V_c,$

which is called the *left Bernoulli shift* over V_c .

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define

$$V_c\beta\colon V_c \to V_c, \quad V_c\beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n\in\mathbb{N}}\in V_c,$$

which is called the *left Bernoulli shift* over V_c .

Analogously, let $V_d = \bigoplus_{n=0}^{\infty} \mathbb{K}$. Clearly, V_d is discrete.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

11/26

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define

$$V_c\beta\colon V_c \to V_c, \quad V_c\beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n\in\mathbb{N}}\in V_c,$$

which is called the *left Bernoulli shift* over V_c .

Analogously, let $V_d = \bigoplus_{n=0}^{\infty} \mathbb{K}$. Clearly, V_d is discrete. Thus

 $\beta_{V_d} \colon V_d \to V_d, \quad \beta_V((x_0, x_1, \ldots)) = (0, x_0, x_1, \ldots), \quad \forall (x_n)_{n \in \mathbb{N}} \in V_d,$

be the right Bernoulli shift over V_d .

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define

$$V_c\beta\colon V_c \to V_c, \quad V_c\beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n\in\mathbb{N}}\in V_c,$$

which is called the *left Bernoulli shift* over V_c .

Analogously, let $V_d = \bigoplus_{n=0}^{\infty} \mathbb{K}$. Clearly, V_d is discrete. Thus

 $\beta_{V_d} \colon V_d \to V_d, \quad \beta_V((x_0, x_1, \ldots)) = (0, x_0, x_1, \ldots), \quad \forall (x_n)_{n \in \mathbb{N}} \in V_d,$

be the right Bernoulli shift over V_d . Easily,

$$\operatorname{ent}(\beta_{V_d}) = 1 = \operatorname{ent}^*(V_c\beta)$$

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define

$$V_c\beta\colon V_c \to V_c, \quad V_c\beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n\in\mathbb{N}}\in V_c,$$

which is called the *left Bernoulli shift* over V_c .

Analogously, let $V_d = \bigoplus_{n=0}^{\infty} \mathbb{K}$. Clearly, V_d is discrete. Thus

 $\beta_{V_d} \colon V_d \to V_d, \quad \beta_V((x_0, x_1, \ldots)) = (0, x_0, x_1, \ldots), \quad \forall (x_n)_{n \in \mathbb{N}} \in V_d,$

be the right Bernoulli shift over V_d . Easily,

$$\operatorname{ent}(\beta_{V_d}) = 1 = \operatorname{ent}^*(_{V_c}\beta)$$

 $\operatorname{ent}(_{V_c}\beta) = 0 = \operatorname{ent}^*(\beta_{V_d}).$

Properties and examples

Limit free formula

Limit free formula (C., Giodano Bruno)

Let V be an l.l.c. space, $\phi: V \to V$ a continuous endomorphism. For every linearly compact open subspace U

• one has an open linear subspace U^- such that

$$H(\phi, U) = \dim\left(rac{U^-}{\phi^{-1}U^-}
ight),$$

• one has a linearly compact subspace U^+ of V such that

$$H^*(\phi,U) = {\sf dim}\, \Bigl(rac{\phi\,U^+}{U^+} \Bigr).$$

Inspired by Willis' work concerning the scale function for totally disconnected LC groups.

20 / 26

Lefschetz Duality

Let $\mathrm{CHom}(\mathrm{V},\mathbb{K})$ be the space of all continuous endomorphisms from V to \mathbb{K} .

Definition

For a linear subspace A of V, the annihilator of A in $\mathrm{CHom}(\mathrm{V},\mathbb{K})$ is defined by

 $A^{\perp} = \{ \chi \in \operatorname{CHom}(\operatorname{V}, \mathbb{K}) : \chi(A) = 0 \}.$

We denote by \widehat{V} the vector space ${\rm CHom}(V,K)$ endowed with the topology locally generated by

 $\{A^{\perp} \mid A \leq V, A \text{ linearly compact}\},\$

which is an I.I.c. space.

Lefschetz Duality

Let $\mathrm{CHom}(\mathrm{V},\mathbb{K})$ be the space of all continuous endomorphisms from V to \mathbb{K} .

Definition

For a linear subspace A of V, the annihilator of A in $\mathrm{CHom}(\mathrm{V},\mathbb{K})$ is defined by

 $A^{\perp} = \{ \chi \in \operatorname{CHom}(\mathbf{V}, \mathbb{K}) : \chi(A) = \mathbf{0} \}.$

We denote by \widehat{V} the vector space ${\rm CHom}(V,K)$ endowed with the topology locally generated by

 $\{A^{\perp} \mid A \leq V, A \text{ linearly compact}\},\$

which is an l.l.c. space.

In particular, V is discrete if, and only if, \hat{V} is linearly compact; V is linearly compact if, and only if, \hat{V} is discrete.

Remark

If dim(V) < ∞ , then \widehat{V} coincide with classical dual space of V.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Lefschetz Duality

Theorem (Lefschetz, 1942)

An l.l.c. space V is topologically isomorphic to \hat{V} .

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Lefschetz Duality

Theorem (Lefschetz, 1942)

An l.l.c. space V is topologically isomorphic to \widehat{V} .

Corollary

The dual functor $V \mapsto \hat{V}$ defines a duality between the full subcategory of all linearly compact spaces and the full subcategory of all discrete vector spaces.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Lefschetz Duality

Theorem (Lefschetz, 1942)

An l.l.c. space V is topologically isomorphic to \widehat{V} .

Corollary

The dual functor $V \mapsto \hat{V}$ defines a duality between the full subcategory of all linearly compact spaces and the full subcategory of all discrete vector spaces.

Remark

This result is the analogue of Pontryagin-van Kampen duality in the context of locally linearly compact spaces.

Bridge Theorem

Theorem (C., Giordano Bruno)

Let V be an l.l.c. space and $\phi : V \to V$ a continuous endomorphism. Then, for every $U \in \mathcal{B}(V)$, $H^*(\phi, U) = H(\widehat{\phi}, U^{\perp})$, where $\widehat{\phi} : \widehat{V} \to \widehat{V}$ is given by $\chi \to \chi \circ \phi$. Consequently, $\operatorname{ent}^*(\phi) = \operatorname{ent}(\widehat{\phi})$.

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Bridge Theorem

Theorem (C., Giordano Bruno)

Let V be an l.l.c. space and $\phi : V \to V$ a continuous endomorphism. Then, for every $U \in \mathcal{B}(V)$, $H^*(\phi, U) = H(\widehat{\phi}, U^{\perp})$, where $\widehat{\phi} : \widehat{V} \to \widehat{V}$ is given by $\chi \to \chi \circ \phi$. Consequently, $\operatorname{ent}^*(\phi) = \operatorname{ent}(\widehat{\phi})$.

D. Dikranjan, A. Giordano Bruno, The Bridge Theorem for totally disconnected LCA groups. Topology and its Appl. **169** (2014)

Entropies for I.I.c. spaces

Addition Theorem for I.I.c. spaces

Example: the Bernoulli shifts

Let $V_c = \prod_{n=0}^{\infty} \mathbb{K}$. Clearly, V_c is linearly compact. One may define

$$V_c\beta\colon V_c o V_c, \quad V_c\beta((x_0, x_1, \ldots)) = (x_1, x_2, x_3, \ldots), \quad \forall (x_n)_{n\in\mathbb{N}}\in V_c,$$

which is called the *left Bernoulli shift* over V_c .

Analogously, let $V_d = \bigoplus_{n=0}^{\infty} \mathbb{K}$. Clearly, V_d is discrete. Thus

$$\beta_{V_d} \colon V_d \to V_d, \quad \beta_V((x_0, x_1, \ldots)) = (0, x_0, x_1, \ldots), \quad \forall (x_n)_{n \in \mathbb{N}} \in V_d,$$

be the right Bernoulli shift over V_d .

Easily, one has that

$$V_{c} = \widehat{V_{d}} \text{ and } V_{c}\beta = \widehat{\beta_{V_{d}}}$$

$$ent(\beta_{V_{d}}) = 1 = ent^{*}(V_{c}\beta)$$

$$ent(V_{c}\beta) = 0 = ent^{*}(\beta_{V_{d}})$$
