- 3 $G = T_m$ is a simple m -od
- 4 Some results

Some notation

Continuum

A continuum X is a nonempty, compact, connected metric space.

Symmetric products

$$F_n(X) = \{A \in 2^X : A \text{ contains at most } n \text{ points}\}$$

where $2^X = \{A \subset X : A \text{ is closed and nonempty}\}$.

2^X is endowed with the Hausdorff metric.

Some notation

Continuum

A continuum X is a nonempty, compact, connected metric space.

Symmetric products

$$F_n(X) = \{A \in 2^X : A \text{ contains at most } n \text{ points}\}$$

where $2^X = \{A \subset X : A \text{ is closed and nonempty}\}$.

2^X is endowed with the Hausdorff metric.

where $2^X = \{A \subset X : A \text{ is closed and nonempty}\}$.

2^X is endowed with the Hausdorff metric.

Finite graphs

A finite graph is a continuum which can be written as the union of finitely many arcs any two of which are either disjoint or intersect only in one or both of their end points

Some notations on finite graphs

If G is a finite graph we denote by

- $\deg(x)$ the degree of a point $x \in G$,
- $\text{Ram}(G)$ the set of ramification points of G , i.e. points with $\deg(x) \geq 3$.

Finite graphs

A finite graph is a continuum which can be written as the union of finitely many arcs any two of which are either disjoint or intersect only in one or both of their end points

Some notations on finite graphs

If G is a finite graph we denote by

- $\deg(x)$ the degree of a point $x \in G$,
- $\text{Ram}(G)$ the set of ramification points of G , i.e points with $\deg(x) \geq 3$.

- $\text{Ram}(G)$ the set of ramification points of G , i.e points with $\deg(x) \geq 3$.

Problem

Question

Is there an embedding $X^n \hookrightarrow F_n(X)$?

We study the case when $X = G$ is a finite graph.

Problem

Question

Is there an embedding $X^n \hookrightarrow F_n(X)$?

We study the case when $X = G$ is a finite graph.

Embedding products in symmetric products

- 1 Basic definitions and notations
- 2 The case $\text{Ram}(G) = \emptyset$
- 3 $G = T_m$ is a simple m -od
- 4 Some results

$$\text{Ram}(G) = \emptyset$$

There are only two cases for which $\text{Ram}(G) = \emptyset$: $G \simeq [0, 1]$ and $G \simeq S^1$.

Proposition

For each $n \in \mathbb{N}$ there is an embedding $[0, 1]^n \hookrightarrow F_n([0, 1])$.

$$\text{Ram}(G) = \emptyset$$

Theorem

For each $n \geq 2$ there is no embedding $\mathbb{T}^n := (S^1)^n \hookrightarrow F_n(S^1)$.

- For $n = 2$, $F_2(S^1)$ is the Möbius strip.
- The case $n = 3$ is a result of E. Castañeda.
- $n \geq 4$: Koyama and Chinen showed that $F_n(S^1)$ contains no copy of any orientable n -dimensional topological manifold.

$$\text{Ram}(G) = \emptyset$$

Theorem

For each $n \geq 2$ there is no embedding $\mathbb{T}^n := (S^1)^n \hookrightarrow F_n(S^1)$.

- For $n = 2$, $F_2(S^1)$ is the Möbius strip.
- The case $n = 3$ is a result of E. Castañeda.
- $n \geq 4$: Koyama and Chinen showed that $F_n(S^1)$ contains no copy of any orientable n -dimensional topological manifold.

$$\text{Ram}(G) = \emptyset$$

Theorem

For each $n \geq 2$ there is no embedding $\mathbb{T}^n := (S^1)^n \hookrightarrow F_n(S^1)$.

- For $n = 2$, $F_2(S^1)$ is the Möbius strip.
- The case $n = 3$ is a result of E. Castañeda.
- $n \geq 4$: Koyama and Chinen showed that $F_n(S^1)$ contains no copy of any orientable n -dimensional topological manifold.

$$\text{Ram}(G) = \emptyset$$

Theorem

Embedding products in symmetric products

- 1 Basic definitions and notations
- 2 The case $\text{Ram}(G) = \emptyset$
- 3 $G = T_m$ is a simple m -od
- 4 Some results

The simple m -od

We denote by T_m the simple m -od.

Theorem (E. Castañeda, J. Sánchez)

For $m \geq 3$ there is no embedding $T_m^2 \hookrightarrow F_2(T_m)$.

The proof uses the fact that T_m^2 is homeomorphic to $\text{Cone}(K_{m,m})$ and $F_2(T_m)$ is homeomorphic to $\text{Cone}(Z)$, where Z is homeomorphic to the complete graph K_m with some arcs at the vertices:

The simple m -od

We denote by T_m the simple m -od.

Theorem (E. Castañeda, J. Sánchez)

Theorem (E. Castañeda, J. Sánchez)

For $m \geq 3$ there is no embedding $T_m^2 \hookrightarrow F_2(T_m)$.

The proof uses the fact that T_m^2 is homeomorphic to $\text{Cone}(K_{m,m})$ and $F_2(T_m)$ is homeomorphic to $\text{Cone}(Z)$, where Z is homeomorphic to the complete graph K_m with some arcs at the vertices:

Theorem

There is an embedding $T_m^2 \hookrightarrow F_3(T_m)$

Proof: $F_3(T_m) \simeq \text{Cone}(\mathcal{A})$, where

$$\mathcal{A} = \{C \in F_3(T_m) : C \cap \{x \in T_m : \deg(x) = 1\} \neq \emptyset\}.$$

\mathcal{A} contains a copy of a torus with m transversal discs, say $T(m)$
 If we get an embedding of $K_{m,m}$ in $T(m)$ we have done because
 we will get an embedding

$$T_m^2 \simeq \text{Cone}(K_{m,m}) \hookrightarrow \text{Cone}(T(m)) \hookrightarrow \text{Cone}(\mathcal{A}) \simeq F_3(T_m).$$

Theorem

There is an embedding $T_m^2 \hookrightarrow F_3(T_m)$

Proof: $F_3(T_m) \simeq \text{Cone}(\mathcal{A})$, where

$$\mathcal{A} = \{C \in F_3(T_m) : C \cap \{x \in T_m : \deg(x) = 1\} \neq \emptyset\}.$$

\mathcal{A} contains a copy of a torus with m transversal discs, say $T(m)$
 If we get an embedding of $K_{m,m}$ in $T(m)$ we have done because
 we will get an embedding

Embedding of $K_{m,m}$ in $T(m)$

Embedding of $K_{m,m}$ in $T(m)$

Embedding products in symmetric products

- 1 Basic definitions and notations
- 2 The case $\text{Ram}(G) = \emptyset$
- 3 $G = T_m$ is a simple m -od
- 4 Some results

Some results

Theorem

There is no embedding $T_m^3 \hookrightarrow F_3(T_m)$ for $m \geq 3$.

The same ideas can be used to proof

Theorem

If G is a graph with $|\text{Ram}(G)| \geq 2$ there is no embedding

$$G^3 \hookrightarrow F_3(G).$$

Some results

Theorem

There is no embedding $T_m^3 \hookrightarrow F_3(T_m)$ for $m \geq 3$.

The same ideas can be used to proof

Theorem

If G is a graph with $|\text{Ram}(G)| \geq 2$ there is no embedding

$$G^3 \hookrightarrow F_3(G).$$

About the proof

Theorem

If G is a graph with $|\text{Ram}(G)| \geq 2$ there is no embedding

$$G^3 \hookrightarrow F_3(G).$$

The key observation is about the type of neighbourhoods of $(p, q, r) \in G^3$, where $p, q, r \in \text{Ram}(G)$: there is no embedding

$$T_m \times T_n \times T_s \hookrightarrow (F_2(T_k) \times [0, 1]) \cup (T_j \times [0, 1]^2)$$

if $k, j \leq \min\{m, n, s\}$

About the proof

Theorem

If G is a graph with $|\text{Ram}(G)| \geq 2$ there is no embedding

$$G^3 \hookrightarrow F_3(G).$$

The key observation is about the type of neighbourhoods of $(p, q, r) \in G^3$, where $p, q, r \in \text{Ram}(G)$: there is no embedding

$$T_m \times T_n \times T_s \hookrightarrow (F_2(T_k) \times [0, 1]) \cup (T_j \times [0, 1]^2)$$

if $k, j \leq \min\{m, n, s\}$

...

Lemma

Let G be a finite graph, $p, q \in \text{Ram}(G)$, $p \neq q$, with the property that $\deg(x) \leq \deg \min\{\deg(p), \deg(q)\}$ for all $x \in G$. Then for each embedding $h : G^3 \rightarrow F_3(G)$ we have

$$|h(p, q, x) \cap \text{Ram}(G)| \geq 2$$

This proof that in the case $\text{Ram}(G) = 2$ there is no embedding.

...

Lemma

Let G be a finite graph, $p, q \in \text{Ram}(G)$, $p \neq q$, with the property that $\deg(x) \leq \deg \min\{\deg(p), \deg(q)\}$ for all $x \in G$. Then for each embedding $h : G^3 \rightarrow F_3(G)$ we have

$$|h(p, q, x) \cap \text{Ram}(G)| \geq 2$$

This proof that in the case $\text{Ram}(G) = 2$ there is no embedding.

...

Lemma

Let G be a finite graph, $p, q, r \in \text{Ram}(G)$ distinct pairwise and with the property that $\deg(x) \leq \deg \min\{\deg(p), \deg(q), \deg(r)\}$ for all $x \in G$. Then for each embedding $h : G^3 \rightarrow F_3(G)$ we have

$$|h(p, q, r) \cap \text{Ram}(G)| = 3$$

A consequence...

We get a characterization of the arc as follows

Corollary

For a finite graph G , there is an embedding $G^3 \hookrightarrow F_3(G)$ if and only if G is homeomorphic to the arc $[0, 1]$.

A consequence...

We get a characterization of the arc as follows

Corollary

For a finite graph G , there is an embedding $G^3 \hookrightarrow F_3(G)$ if and only if G is homeomorphic to the arc $[0, 1]$.
